

360° backup control.

Less monitoring and tougher security for your backups. You have your own backup solution that you run yourself and don't want to transfer to the cloud, but you don't have the internal resources needed for reliable monitoring and trouble-shooting. The ideal solution for your requirements would be a service that regularly monitors your backups and acts when there's an issue.

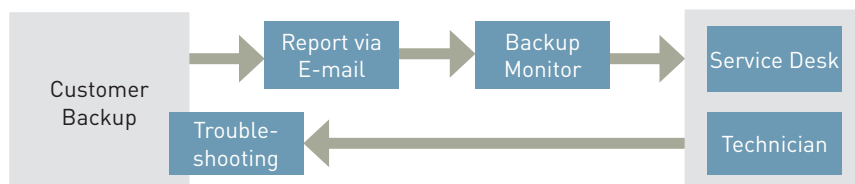

360° backup control monitors the status reports of your backups. Our Service Desk checks the reports from Monday to Friday. If they find a backup with issues, they immediately notify the technician responsible who then resolves the issue, while you continue to concentrate on your business.

- No more internal backup monitoring
- Automated acceptance of trouble-shooting by a technician
- More internal resources
- 360° backup control supports all current backup tools such as Veeam, Backup Exec, vRanger, and more
- Daily, weekly, and monthly backups are checked separately
- If a report does not materialise, the reason will be checked

Spare yourself the unnecessary hassle of monitoring your backups and trouble-shooting with 360° backup control, which monitors your backups and sends a daily report to our Service Desk. Issues are detected and resolved by our technicians.
